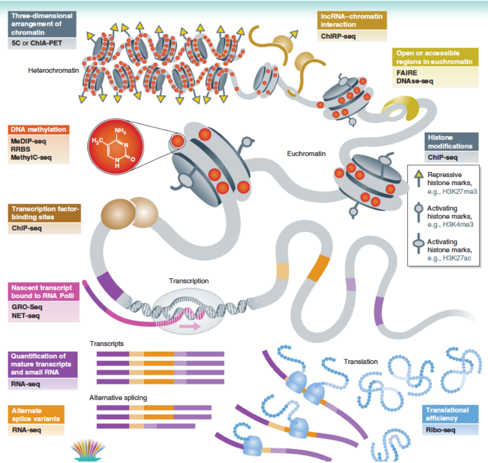
High-Throughput Genomics Panorama[1]



Three-dimensional arrangement of chromatin
5C or ChIA-PET
Heterochromatin
lncRNA–chromatin interaction
ChIRP-seq
Open or accessible regions in euchromatin
FAIRE
DNAse-seq
DNA methylation
MeDIP-seq
RRBS
MethylC-seq
NH2
H3C
N
N
H
O
Euchromatin
Histone modifications
ChIP-seq
Repressive histone marks, e.g., H3K27me3
Activating histone marks, e.g., H3K4me3
Activating histone marks, e.g., H3K27ac
Transcription factor-binding sites
ChIP-seq
Transcription
Nascent transcript bound to RNA PolII
GRO-Seq
NET-seq
Transcripts
Quantification of mature transcripts and small RNA
RNA-seq
Alternative splicing
Alternate splice variants
RNA-seq
Translation
Translational efficiency
Ribo-seq

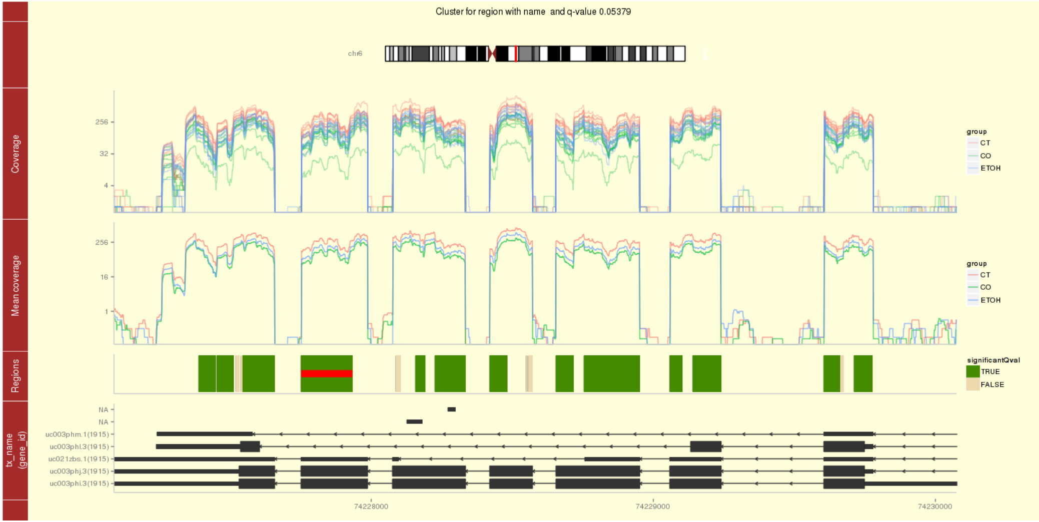
What is common?

- Measurements along the genome (sometimes summarized)
- Two or more groups of samples
- Typical question: are there differences between the groups?
  - → Find the candidate regions.

Issue: regions might be highly fragmented.
Why?

1. Biological reasons: regions correspond to two exons (intron is the cause).
2. Measurement not ideal: coverage dips.

Example region cluster (by distance)



Question

Are two adjacent regions *similar*?

1. Can we link them?
2. a

Translating framework

- What is measured?
  - Coverage $=:$ Y
  - Transformed: $\log_2(Y + 32)$
- Individual (cluster of measurements) → sample
- Repeated visits → individual base pairs (from a given chromosome)
  - Note that the data is correlated!

Consider a region pair:

1. region1: first region
2. regionM: middle part
3. region2: second region

Proposed method

Model for sample i:

$$\log_2(Y_{ijk} + 32) = \alpha + \beta_1 \text{sampleDepth}_i + \boldsymbol{\beta}_2 \text{group}_j + \boldsymbol{\beta}_3 \text{region}_k + \epsilon$$

Using *region1* as the reference, we want to test $\boldsymbol{\beta}_3\,(\text{region}_2) = 0$.

derHippo chr 6

- 25 samples
- 3 groups: CO, ETOH and CT
- 890 pairs; most short:
  - $\sim$ 32% with all regions (1, M, 2) having a width greater than 1
  - $\sim$ 18% greater with all widths greater than 2
- Chose the largest cluster, then the pair starting with the largest region from the cluster.
